

NightVision Guardian AI - Detection Report

Upload ID: 4

Risk Level: HIGH

AI Explanation:

Brief Intelligent Explanation:

This detection result indicates the presence of multiple potential individuals within the surveillance area during nighttime. There are **11** total detections classified as 'person'. Critically, **5** of these detections have high confidence levels (above 70%), strongly suggesting the presence of at least five actual individuals. An additional two detections are in the medium confidence range (60-70%), which could also represent people, especially under challenging night conditions. The remaining four detections have very low confidence (below 40%) and are highly likely to be false positives due to shadows, reflections, environmental noise, or non-human objects, though they cannot be entirely dismissed without visual confirmation in a night surveillance context. The system is clearly identifying a significant number of entities it believes to be people, with a strong core of highly confident detections.

Risk Level: HIGH

Justification: The presence of multiple high-confidence detections of "person" (at least 5 individuals identified with over 70% confidence) in a night surveillance scenario represents a significant and credible threat or unauthorized activity. While some of the lower-confidence detections may be false alarms, the robust higher-confidence detections confirm a substantial human presence that warrants immediate attention and investigation. Unauthorized individuals or a large group operating under the cover of darkness inherently elevates the risk.

Detected Objects:

- person (87.26%)
- person (78.63%)
- person (78.26%)
- person (75.67%)
- person (73.98%)
- person (65.13%)
- person (61.11%)
- person (35.69%)
