

NightVision Guardian AI - Detection Report

Upload ID: 6

Risk Level: HIGH

AI Explanation:

****Intelligent Explanation:****

The system has identified a significant number of potential human forms (11 detections) within the surveillance area during night conditions. While only one detection has a high confidence level (75.18%), the sheer volume of additional detections, even with lower confidence scores (ranging from 47.34% down to 25.67%), strongly suggests the presence of multiple individuals. Night conditions often lead to reduced confidence due to poor lighting, shadows, and image noise, making objects harder to discern. Therefore, even the lower confidence scores, when grouped in such quantity, indicate a high likelihood of a gathering or multiple people rather than isolated false positives.

****Risk Level:** HIGH****

****Reasoning:**** The detection of 11 potential individuals by a night surveillance system immediately constitutes a high-risk scenario. Regardless of individual confidence scores, the collective count points to a significant unauthorized presence or activity. This situation warrants immediate human review and potential security response, as it could indicate:

- * A group attempting to bypass security.
- * A crowd gathering in a restricted area.
- * Multiple intruders.
- * A significant event occurring on premises.

Detected Objects:

- person (75.18%)
- person (47.34%)
- person (46.3%)
- person (45.01%)
- person (39.73%)
- person (35.86%)
- person (32.89%)
- person (30.92%)
- person (28.18%)
